6 Everyday use and help

QUICK

26. Rename, move, switch off and tidy up

Quick version

No time to read it all? This is the short version. The full guide is below.

- **Rename or move a file or folder:** menu `M`, then `18` (or menu `8`, then `8`). Every place that uses the name changes with it: the code, the pages, the photo lists and the database.
- It shows you every place first, offers a backup, and changes **nothing** until you type `y`.
- **The guides keep the old names.** After a rename they show the names the garden came with. `logs/renames.tsv` lists what is called what now (menu `M`, `18`, then `4`).
- **The on / off switch:** menu `M`, then `14`. **Off** stops everything and deletes nothing. **On** works even months later and checks the website.
- **Check-up** starts again a program that is stuck. **Clean-up** removes only Docker's leftovers, never your plants, photos, data, cache or backups.
- On Windows the Windows menu has the same: `M`, then `20` (rename) and `15` (switch).
- These are plain scripts, with no AI inside: each does one job, and you can read every line.
