6b The terminal way (bash), harder but not tough

QUICK

22. Bash, step by step: a first walkthrough of the terminal

Quick version

No time to read it all? This is the short version. The full guide is below.

- The **terminal** is a window where you type commands instead of clicking. **Bash** is the program inside it that reads what you type and runs it.
- Open it on Ubuntu with **Ctrl+Alt+T**. On Windows, use the **Garden terminal** shortcut (Windows menu, More, 18).
- Type a command, press **Enter**, read what it prints. Nothing happens until you press Enter.
- Five commands take you a long way: `pwd` (where am I?), `ls` (what is here?), `cd` (go to a folder), `less` (read a file), `clear` (clean the screen).
- Run the garden program with `cd ~/junsgarden-for-jun` and then `bash garden.sh`.
- When the computer asks for your password, **nothing shows while you type**. That is normal: type it and press Enter.
- **Ctrl+C** stops what is running. In a terminal, copy is **Ctrl+Shift+C** and paste is **Ctrl+Shift+V**.
- `rm` deletes for good (there is no Recycle Bin). Never paste commands from people you do not know.
- **Shortcuts:** Up arrow brings back the last command, Tab finishes names, Ctrl+R searches what you typed before.
- **Make and edit a file:** `touch notes.txt` makes it, `nano notes.txt` edits it (Ctrl+O, Enter saves; Ctrl+X leaves).

- **Seems stuck?** Ctrl+C, then `q`, then close the window and open a new one. The garden's install carries on where it stopped.
- **Updates:** `sudo apt update`, then `sudo apt upgrade`, about once a week.
- **Your password** is also the `sudo` password: it proves you may do administrator work. Keep it in a password manager.
