8 Projects (optional, for fun)

QUICK

n8n 1. Install n8n and send yourself an email

Quick version

No time to read it all? This is the short version. The full guide is below.

- n8n (say "n-eight-n") in Docker, connected to your own Gmail, and a first workflow that emails you when you click a button.
- Easy, 45 minutes, free. Do guide 02 (Docker) first.
- Start it: `docker compose -f docker/extras/n8n.yml up -d`, then open http://localhost:5678 and make an owner account with a **new** password.
- Already switched n8n on in the menu (menu `9`, Parts)? Then it is running (and in your backups): skip the start command. Use one way or the other, not both: both run as `garden-n8n`.
- Make a Gmail app password (2-Step Verification must be on). Google shows it only once.
- In n8n, make an SMTP credential: host `smtp.gmail.com`, port `465`, SSL/TLS on.
- Make a workflow: **Trigger manually**, then **Send Email**. Click **Execute workflow** and check your inbox (and spam).
- Never paste the app password into a chat, a document or a screenshot. If it leaks, delete it in your Google account and make a new one.
