8 Projects (optional, for fun)

FULL

Project 1. Uptime Kuma: know when your site is down

Quick version

No time to read it all? This is the short version. The full guide is below.

- A dashboard that checks your garden website every minute and shows a green or red dot.
- Easy, 20 minutes, free. Do guides 01 to 03 first.
- Start it: `docker compose -f docker/extras/uptime-kuma.yml up -d`, then open http://localhost:3001 and make an admin account.
- **Add New Monitor**: type HTTP(s), URL `http://host.docker.internal:8030/healthz`, interval 60.
- Test the alarm: `docker compose stop site` turns the dot red within about a minute. `docker compose start site` turns it green again.
- If you open port 8030 to your home network (step 4), never forward port 8030 on your router.

Level: easy. **Time:** 20 minutes. **Cost:** free.

What you will build

A dashboard that checks your garden website every minute and shows a green or red dot. Later it can send a message to your phone when something goes down.

What you need first

- Guides 01 to 03 done.

Steps

1. From the `junsgarden-for-jun` folder, start it:

```
docker compose -f docker/extras/uptime-kuma.yml up -d
```

You should see: `Container uptime-kuma Started`. 2. Open **http://localhost:3001**. The first visit asks you to make an admin username and password. Make them and save the password in your password manager. 3. Click **Add New Monitor**. - Monitor Type: **HTTP(s)** - Friendly Name: `Garden website` - URL: `http://host.docker.internal:8030/healthz` - Heartbeat Interval: 60 4. If step 3 shows red with "ENOTFOUND host.docker.internal", use the laptop's address from guide 01 instead: `http://192.168.x.x:8030/healthz`. (The garden only listens on this laptop's own door, so also edit `docker-compose.yml`: change `"127.0.0.1:8030:8030"` to `"8030:8030"`, run `docker compose up -d`, and know the garden is now visible to your home network. That is fine at home; do not forward port 8030 on your router.) 5. Click **Save**. *You should see:* a green dot and "Up".

How you know it worked

Run `docker compose stop site`. Within about a minute the dot turns red. Run `docker compose start site`. It turns green again. You just tested an alarm.

If something goes differently

What you see	What to do
Red, "ECONNREFUSED"	The garden container is stopped, or step 4 applies.

What you see	What to do
Cannot open port 3001	`docker ps` shows `uptime-kuma`? If not, run step 1 again.

Make it yours

- Add a monitor for `https://www.google.com` so you can tell "my site is down" from "my internet is down".
- In Settings, Notifications, add Telegram or email so your phone buzzes.
- After guide 04 is done, add a monitor for your public name.
