8 Projects (optional, for fun)

QUICK

Project 8. Your sensor readings on your own website

Quick version

No time to read it all? This is the short version. The full guide is below.

- A small Python script copies your soil sensor's number from Home Assistant into your website's database every 15 minutes, for your **Data** page.
- Hard, about 3 hours, free. Do Projects 3 and 6, and guide 03, first.
- Make a Home Assistant long-lived token and save it in the private file `docker/.ha.env` as `HA_TOKEN=...`.
- Put your sensor's name in `SENSORS` in `docker/extras/ha_to_garden.py`.
- Run it once: `python3 docker/extras/ha_to_garden.py`. You should see `Saved 1 reading(s) at ...`.
- Make it run every 15 minutes with one line in `crontab -e`.
- Finding your number on the Data page is exploring. If it does not show, `rust/junsgarden/src/pages/data.rs` explains which widgets read it.
