# Adding a plant, with the local plant AI

*Jun's Garden, the plant admin (`/streamlit/`). Every picture is from a test garden with made-up sample plants. The AI's answers in the pictures are a recorded sample run.*

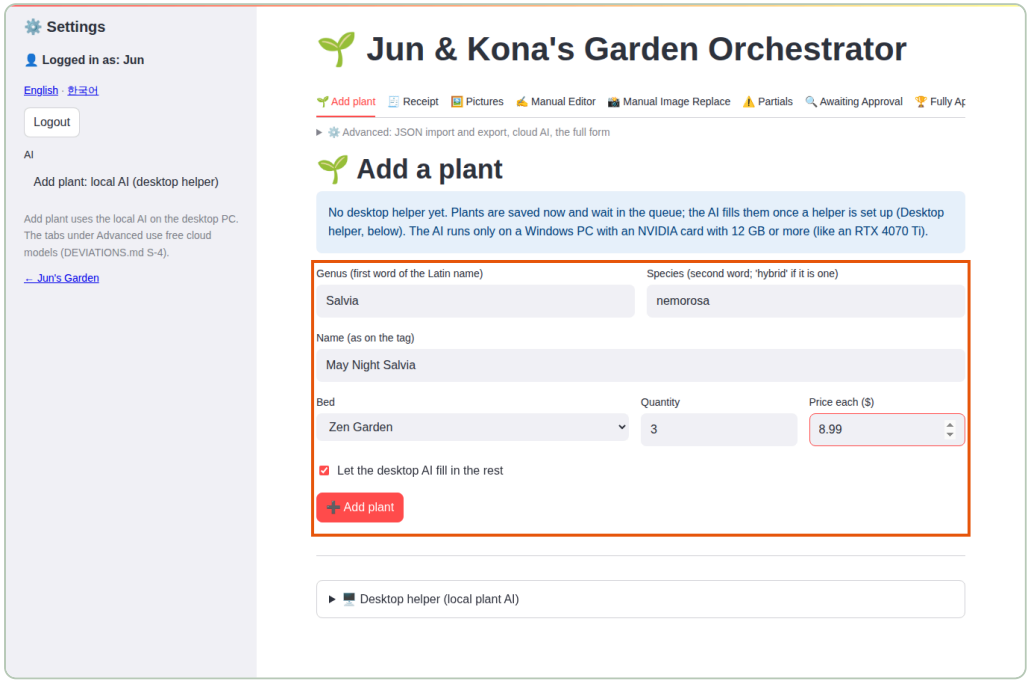

> **Where the AI runs.** The AI that fills in new plants runs only on a **Windows PC with an NVIDIA graphics card with 12 GB or more** (like an RTX 4070 Ti). It is set up by the Windows setup wizard (CUSTOM, "Local plant AI"), or later by the Windows menu, More, 22. The website itself can run on another computer, for example the laptop: the PC asks the website for work every minute, over your home network. Nothing new is opened on either computer. If the PC is off, new plants simply wait in the queue and are filled in when it is on again.

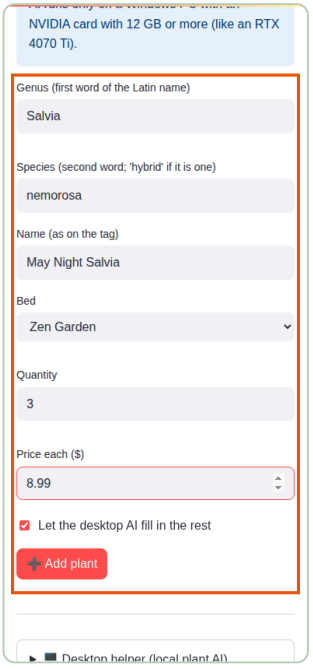

## 1. Add plant: six boxes

Open the plant admin. The first tab, 🌱 **Add plant**, asks for only six things:

- **Genus**: the first word of the Latin name, for example *Salvia*.
- **Species**: the second word, for example *nemorosa* (write *hybrid* for a hybrid; empty if you do not know it).
- **Name**: the name as it is on the tag.
- **Bed**, **Quantity** and **Price each**.

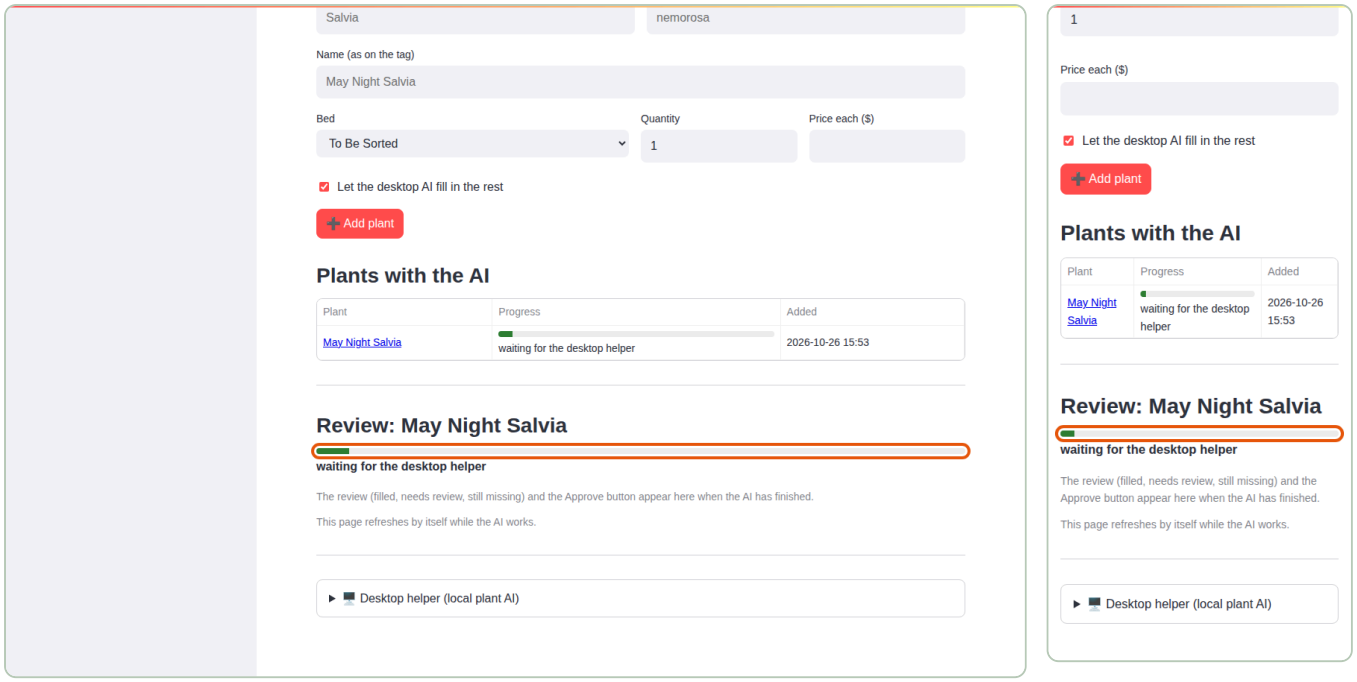

Leave **Let the desktop AI fill in the rest** ticked and press ➕ **Add plant**. The plant is saved at once; the AI fills in the rest.

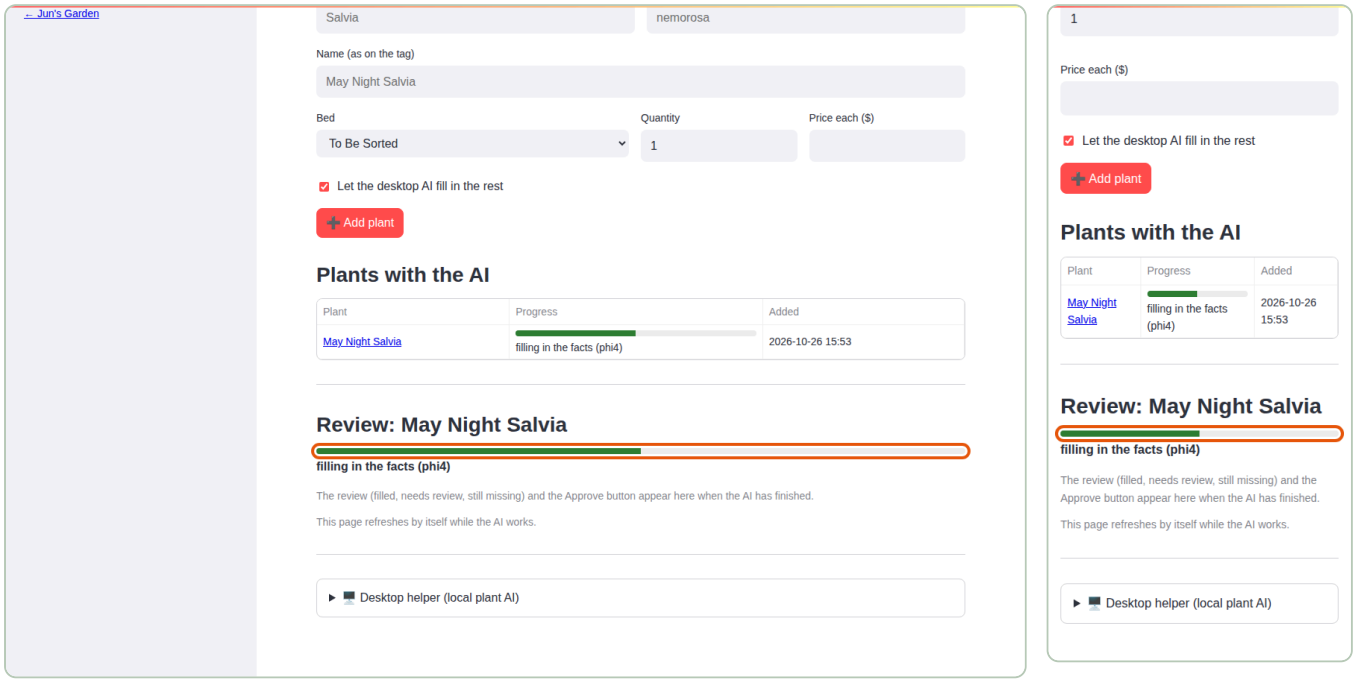

# 2. Watch the AI fill it in

The page shows the plant in **Plants with the AI**, with a bar, and the same bar under **Review**. It goes: *waiting for the desktop helper* → *searching the web* → *filling in the facts (phi4)* → *finding photos* → *checking every value (gemma)* → *ready for your review*. The page refreshes by itself while the AI works; you can also close it and come back later.

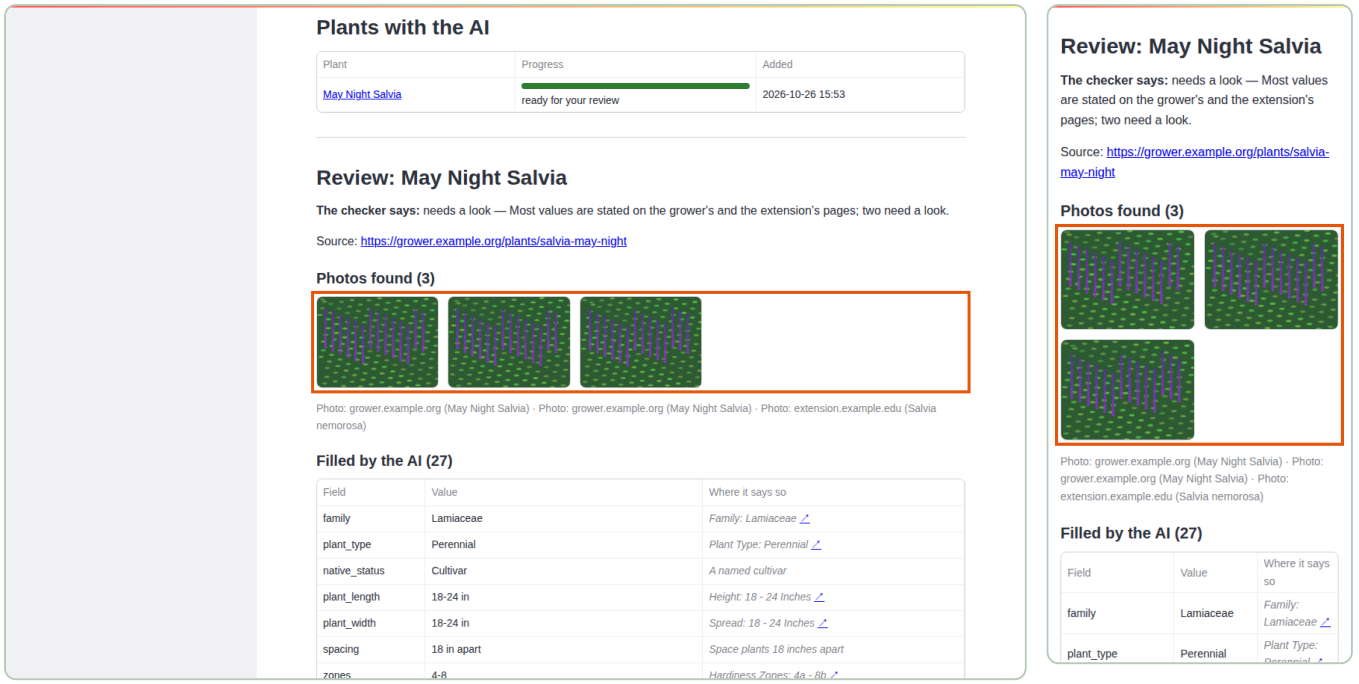

What happens on the PC: the helper finds the grower's page for this plant and up to three trusted garden pages (university extension, botanical gardens), reads them politely (a few seconds between pages), fills in every field the pages state, finds up to 5 photos, and then a second model checks every value against the sentence it came from.

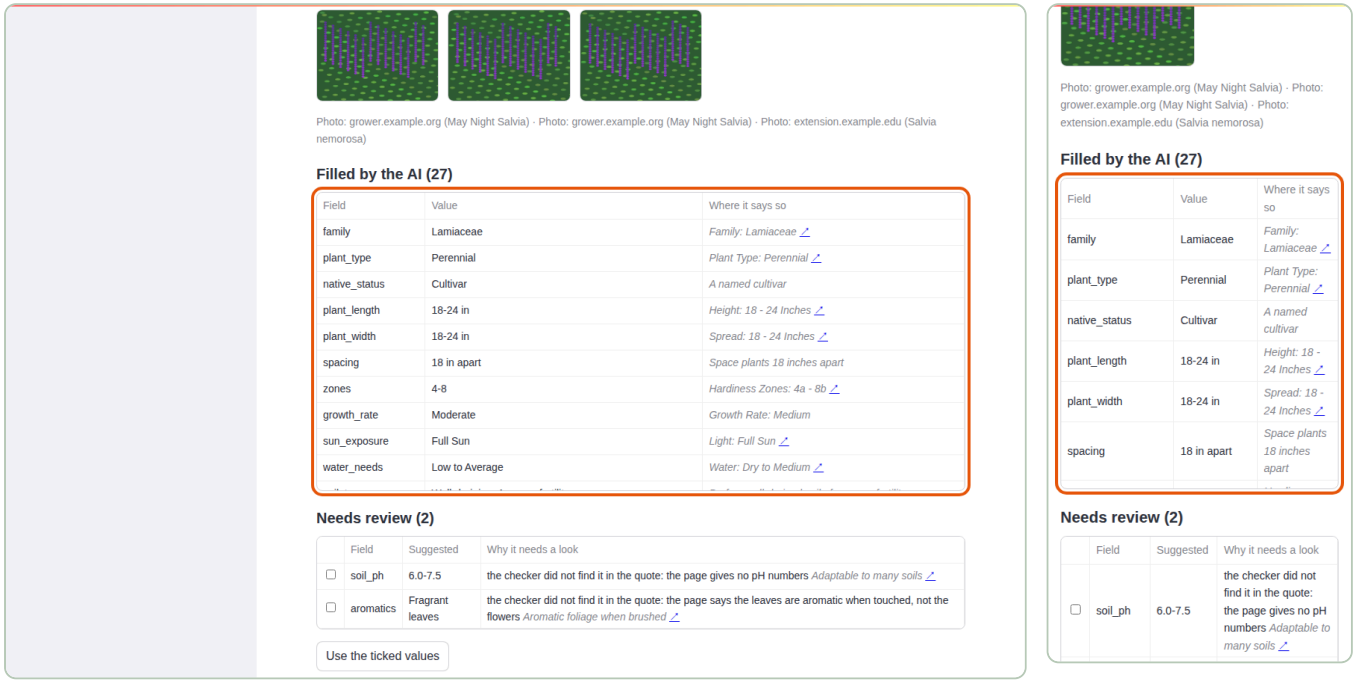

# 3. The review: filled, needs review, still missing

When the answers are in, the same page shows the review:

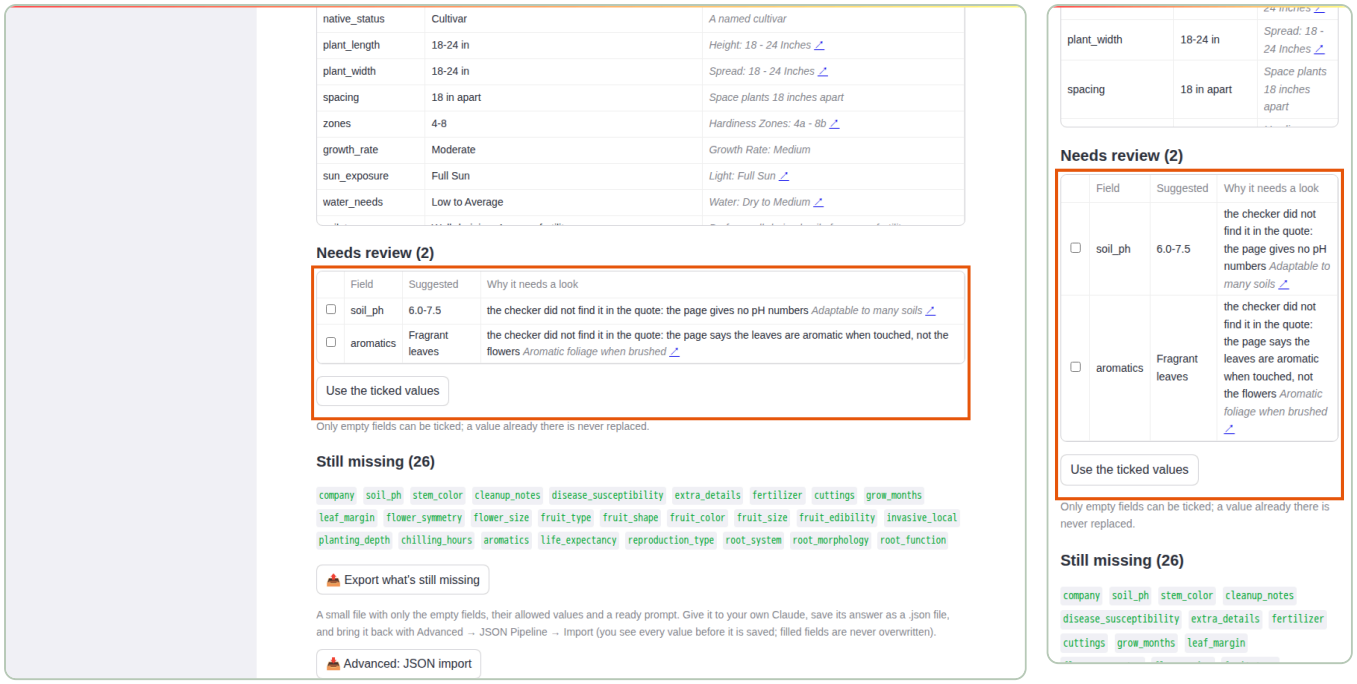

- **The checker says**: a one-line verdict (*looks right*, or *needs a look*).
- **Source**: the grower's page the facts came from (it is also saved with the plant).
- **Photos found**: up to 5, each saved once as a `.webp` picture. The small line under them says where each one came from.

- **Filled by the AI**: every value that was written, each with the words on the page that say so and a ↗ link to that page. The AI only fills **empty** fields; a value you typed is never replaced. A copy of the plant is kept before every change.

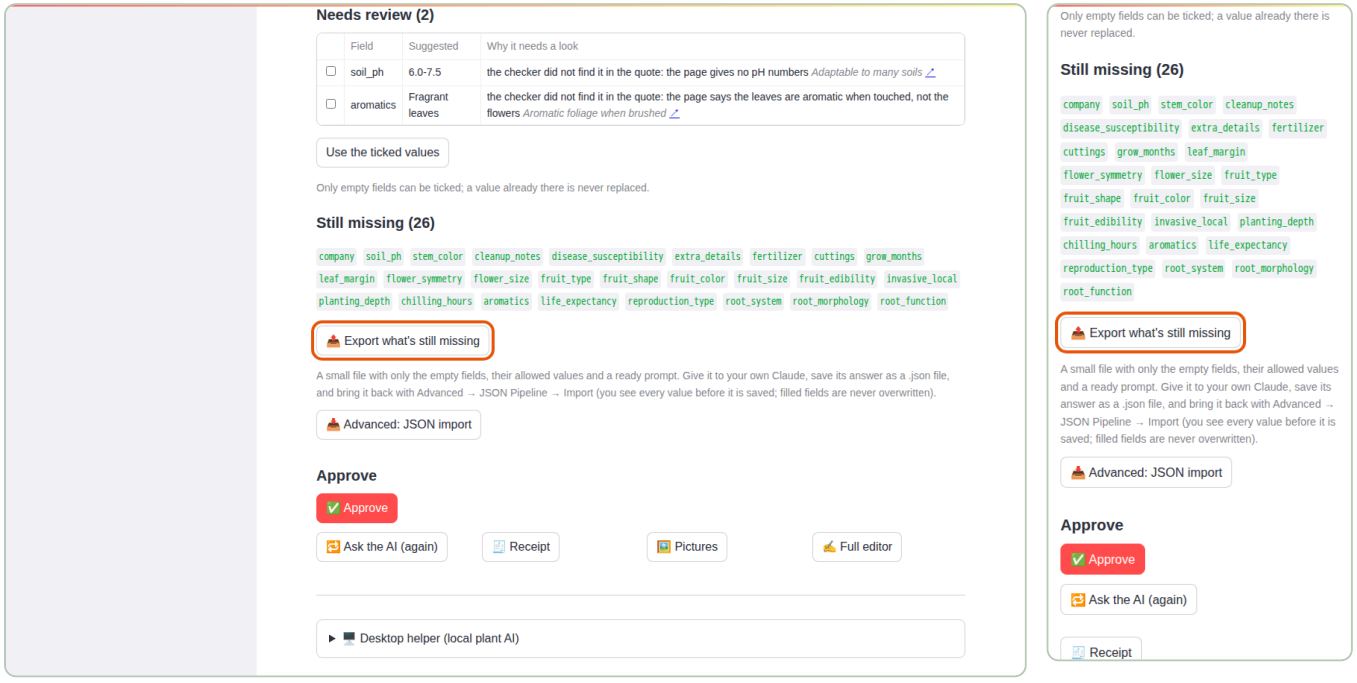

- **Needs review**: values the checker could not confirm. They are **not** written. Tick the ones you agree with and press **Use the ticked values** (only empty fields can be ticked).

## 4. Still missing: ask your own Claude

**Still missing** lists the fields that are still empty. Press 📤 **Export what's still missing**: you get a small file with only those fields, the values each one allows, and a ready prompt (in English and Korean). Give the file to your own Claude. Save its answer (a JSON list) as a `.json` file and bring it back with ⚙️ **Advanced** → 🔄 **JSON Pipeline** → 📥 **Import & Review** (step 8). You see every value before anything is saved.

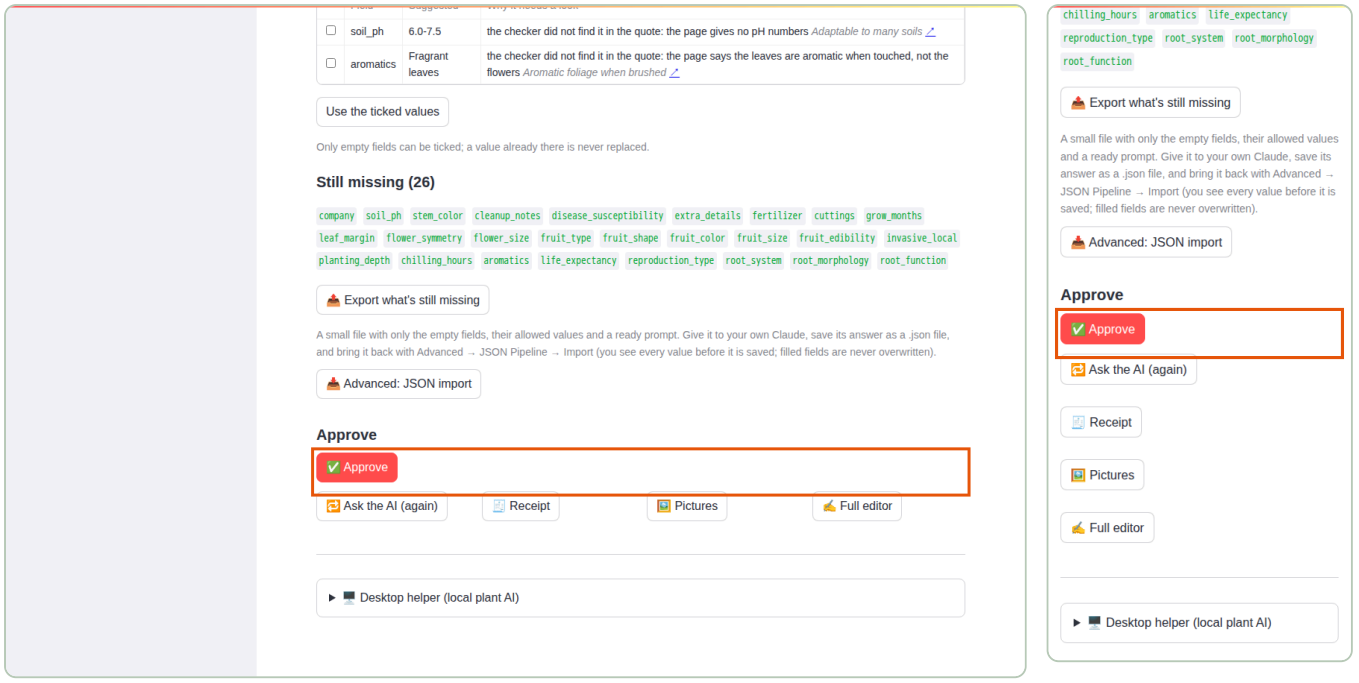

The ready prompt, as it is in the file:

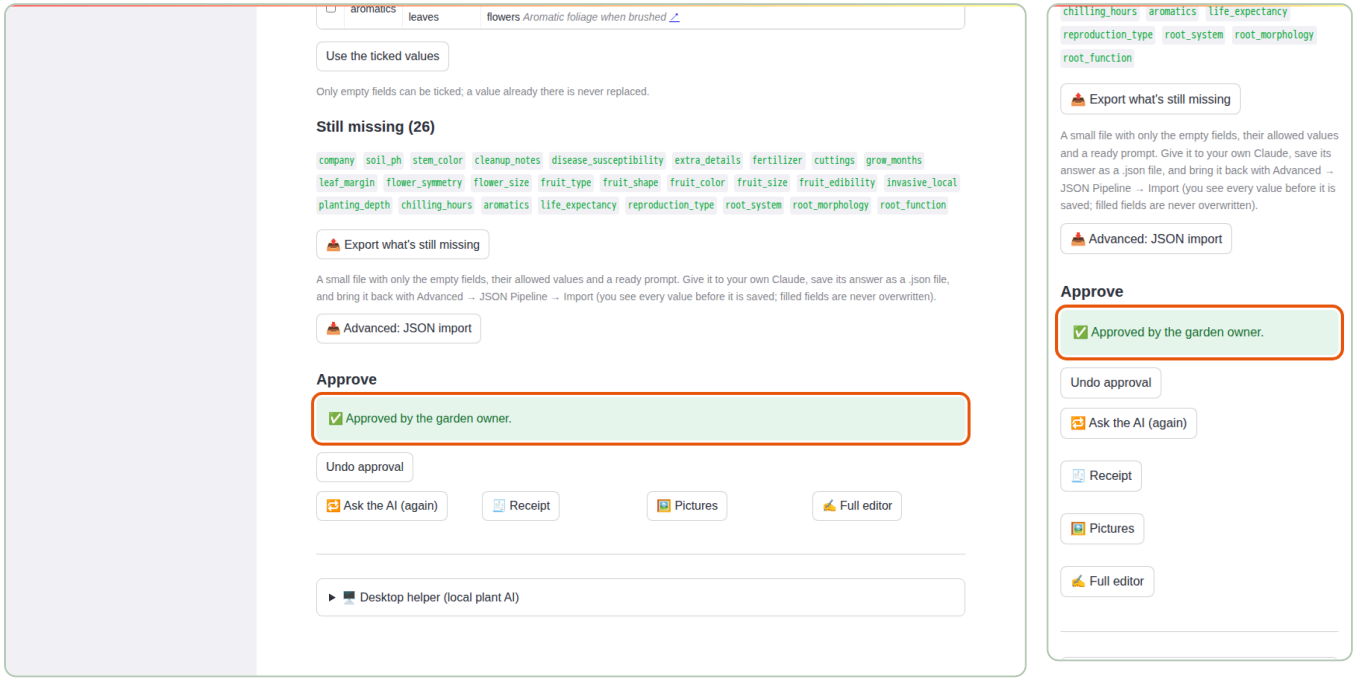

```
You are helping fill in a garden plant database. The file below lists plants and, for each,
ONLY the fields that are still empty, with the allowed values and the expected format.
Rules: 1) Answer with ONLY a JSON array (a top-level [ ... ]) ... 2) Include only the empty
fields listed for that plant; never add or change any other field. 3) For a field with
"allowed" values, use one of them exactly ... 5) If you are not sure of a value, leave it out:
an empty field is better than a wrong one.
```

## 5. Approve

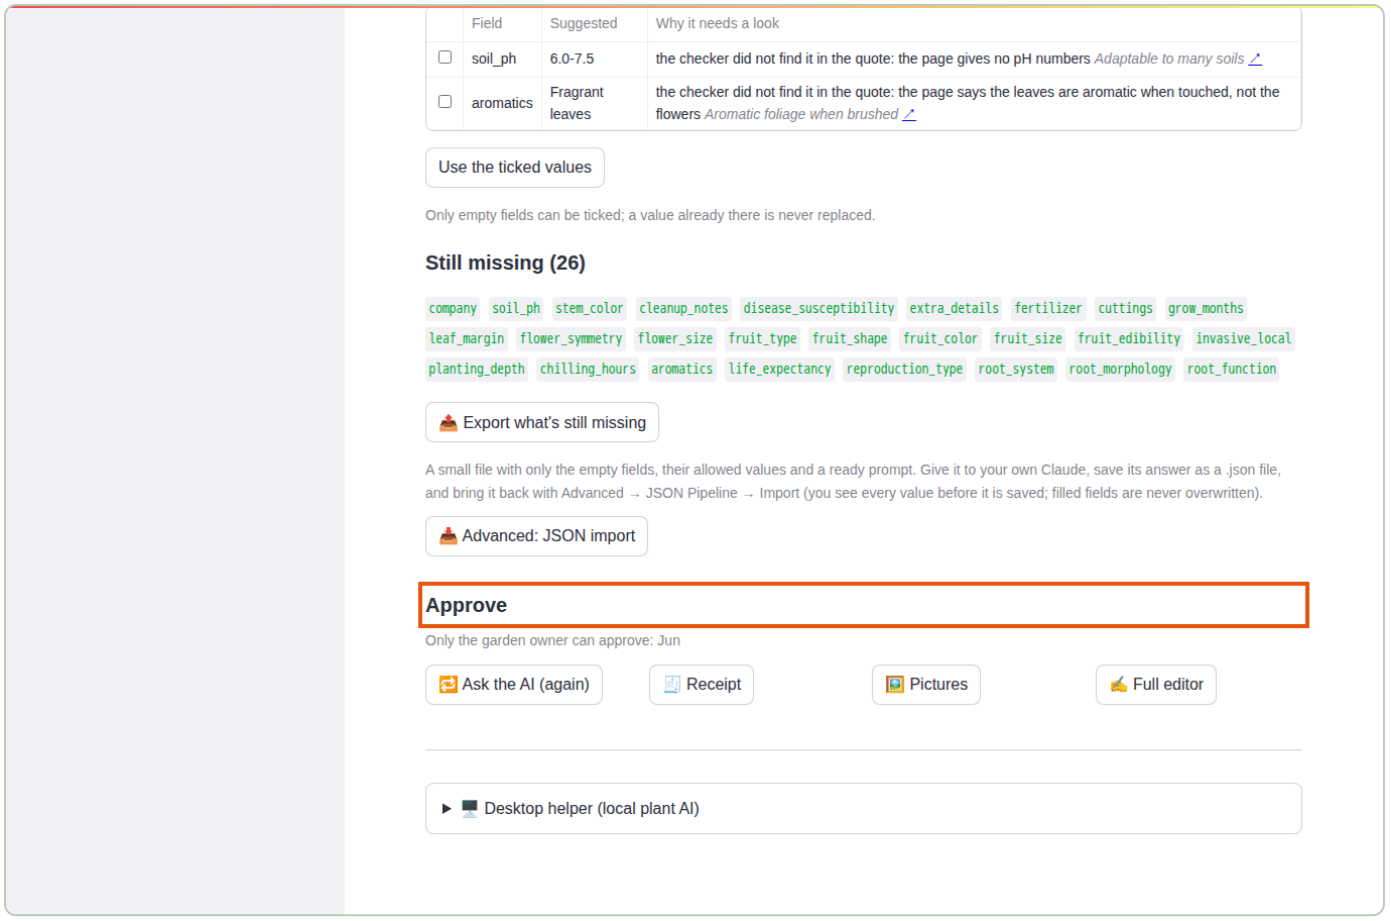

At the bottom of the review is ✅ **Approve**. Press it when the plant looks right. Only the **garden owner** (you, Jun) can approve; anyone else signed in sees who can.

After pressing it: *Approved by the garden owner*. **Undo approval** takes it back.

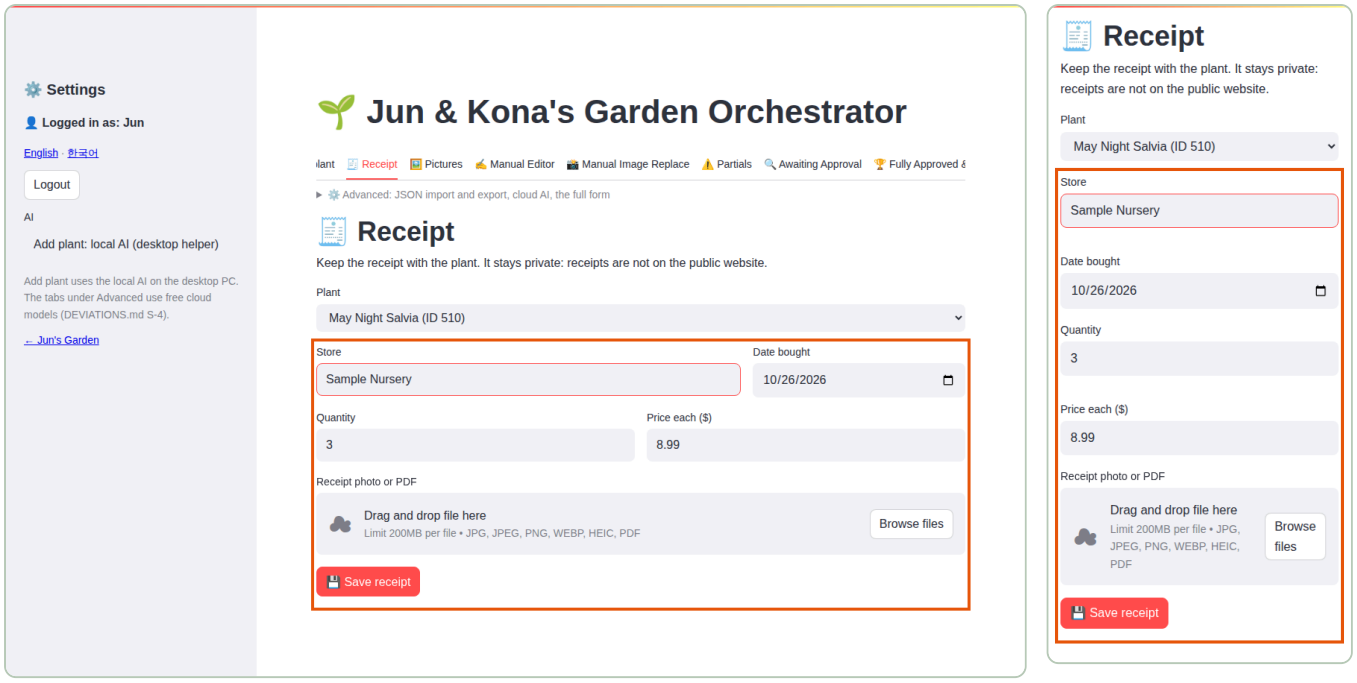

What another account sees (it cannot approve):

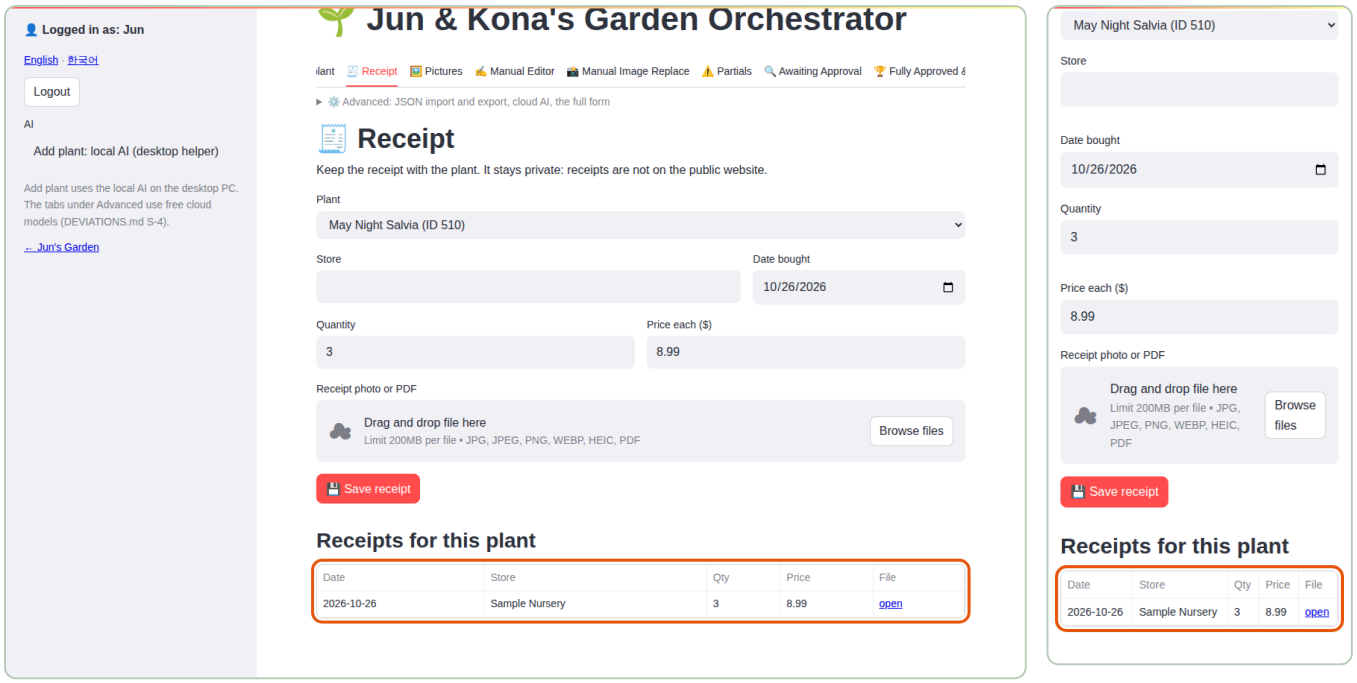

## 6. Receipt

The 🧾 **Receipt** tab keeps the receipt with the plant: choose the plant (the newest is first), type the store, the date and the price, choose the photo or PDF of the receipt and press 💾 **Save receipt**. Receipts are private: they are never on the public website.

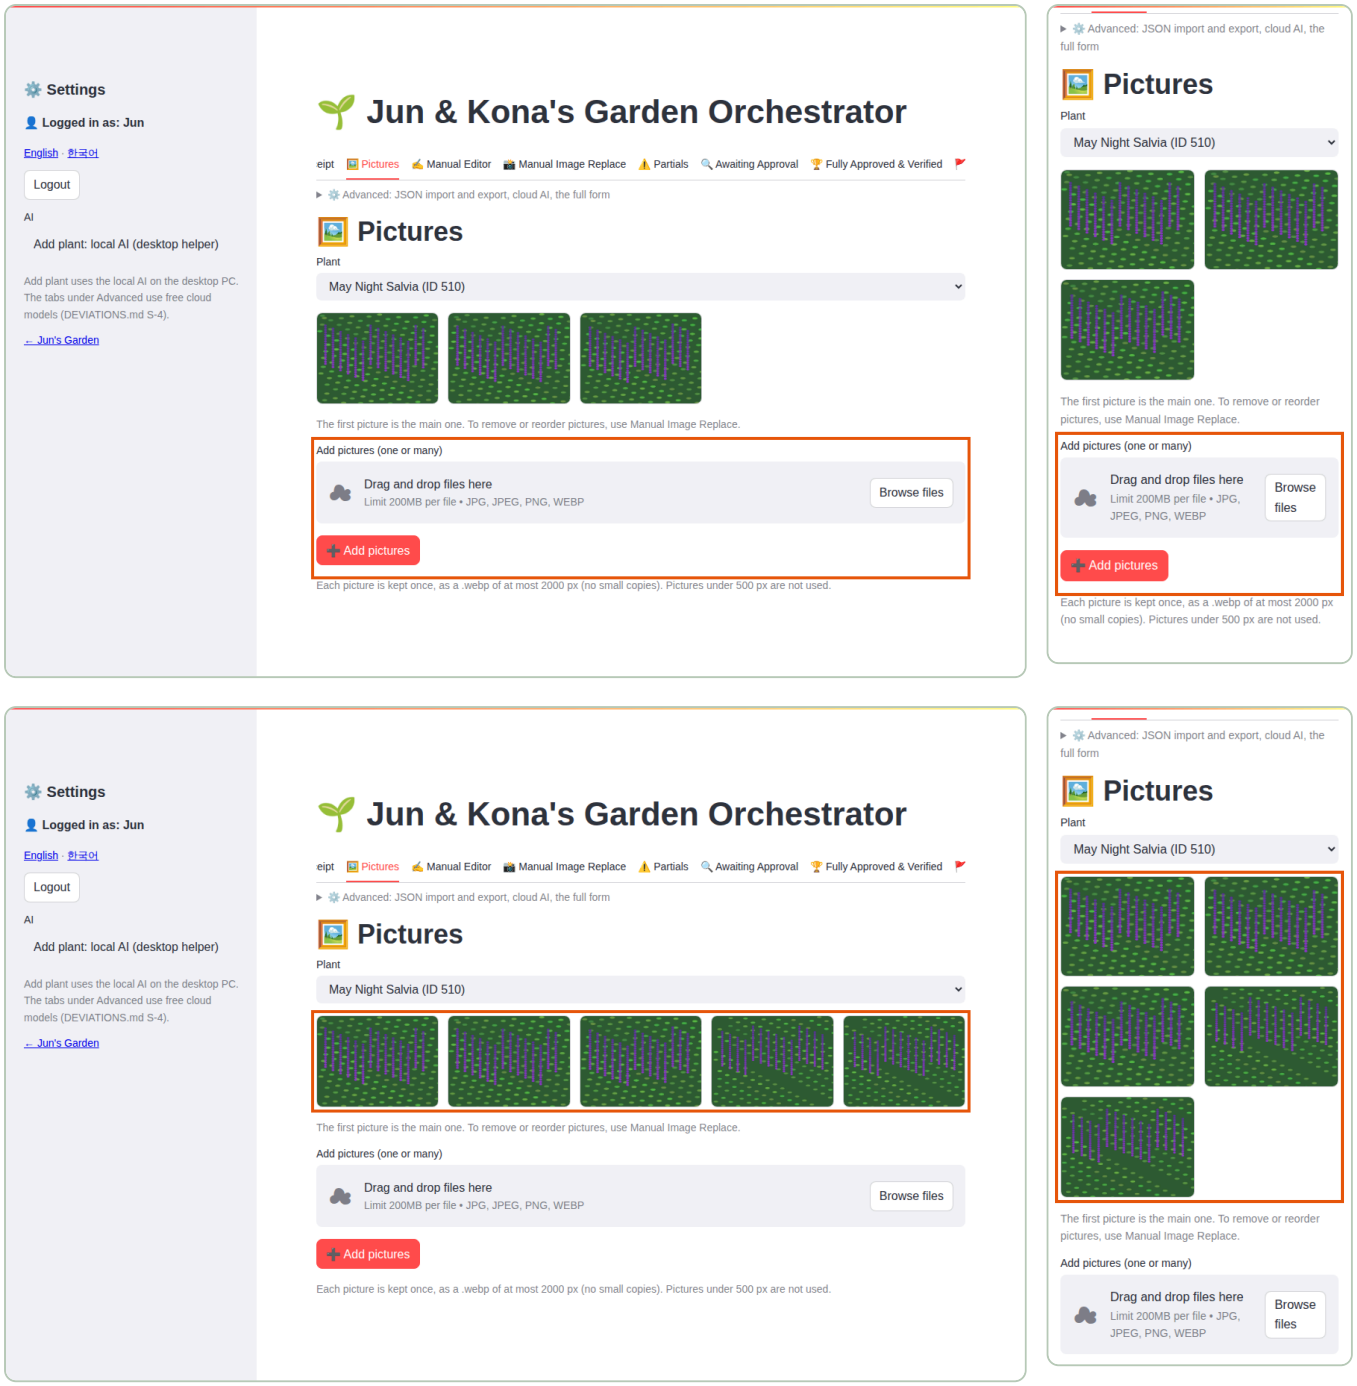

The receipts kept for the plant are listed under the form, each with an **open** link.

# 7. Pictures

The 🖼️ **Pictures** tab adds your own photos: choose the plant, choose one or many pictures, press ➕ **Add pictures**. Each picture is kept once, as a `.webp` of at most 2000 pixels (no small copies are made); pictures smaller than 500 pixels are not used. The first picture is the main one; to remove or reorder pictures use *Manual Image Replace*.

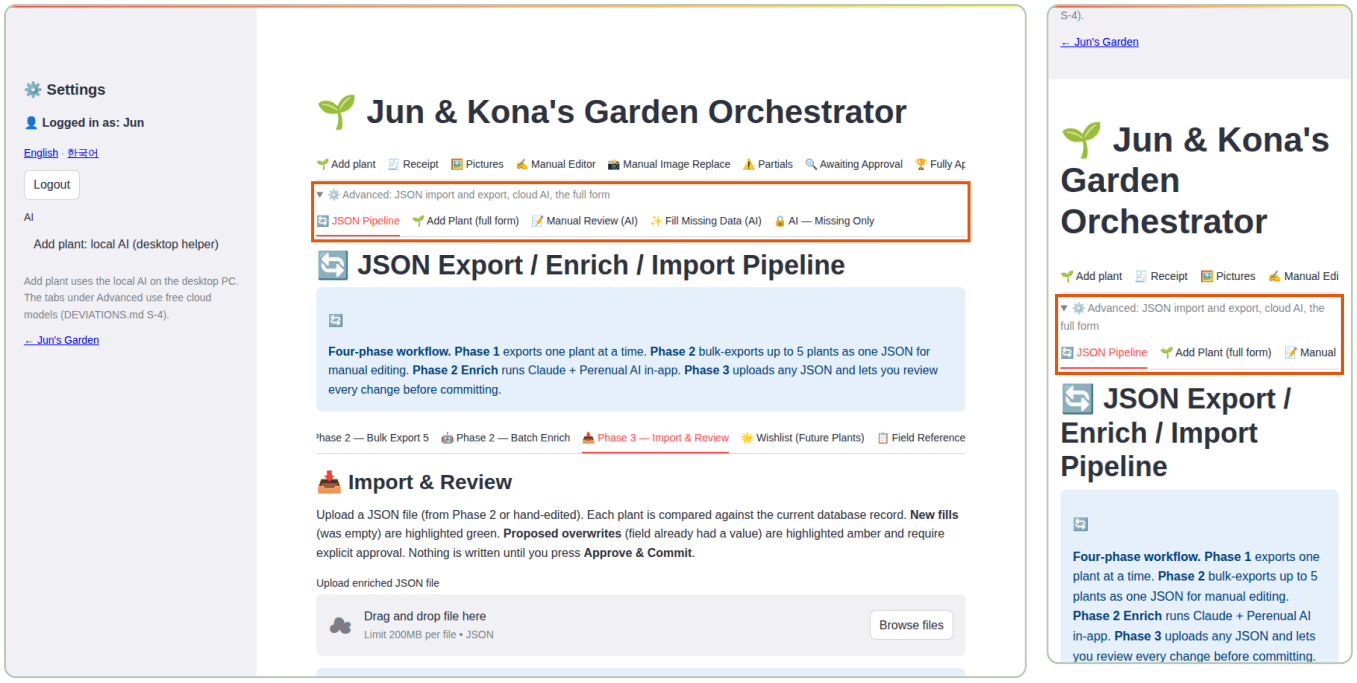

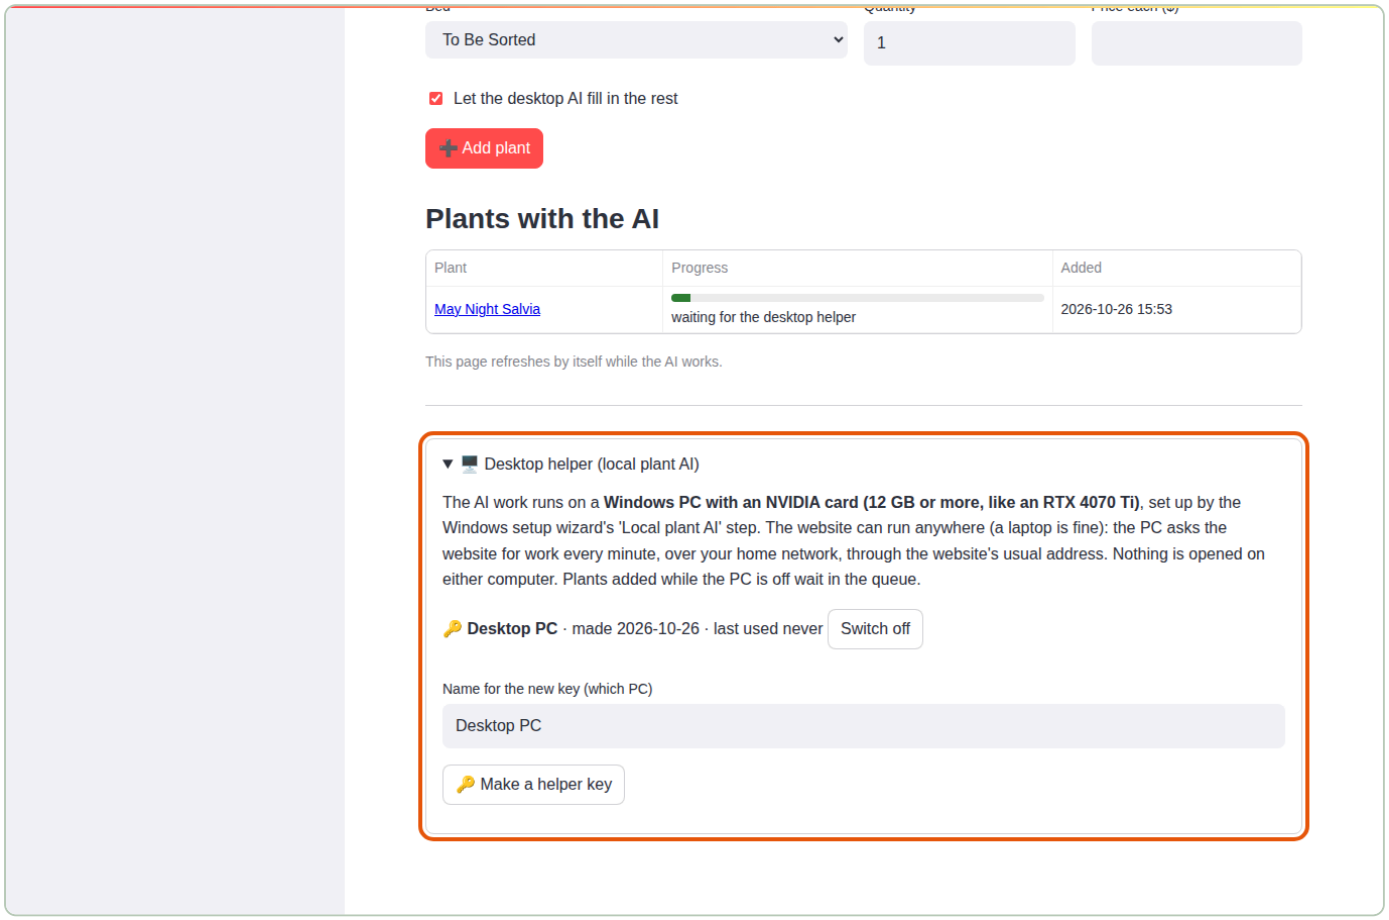

## 8. Advanced: JSON import and the other tools

The JSON import is still there, under ⚙️ **Advanced** (under the tabs). Advanced also holds the cloud-AI tabs and the full Add Plant form. You only need it for step 4's answer.

## 9. The desktop helper's key

The PC needs a key to talk to the website. On the Add plant tab, open 🖥️ **Desktop helper**, type a name for the PC and press 🔑 **Make a helper key**. The key is shown **once**: paste it into the Windows setup wizard's Local plant AI page (or the Windows menu, More, 22). The list shows when each key was last used, and **Switch off** stops a key at once.

## Good to know

- The language: the **English · 한국어** links in the sidebar switch the new tabs.
- The AI never changes a value you typed, never writes what the checker did not confirm, and a copy of the plant is kept before every change.
- The laptop alone (no Windows PC) still works: plants are saved and wait in the queue; you can fill them in by hand in the *Manual Editor*, or with step 4.
- Questions: ask the author.
