Jun's Guide

How to add and edit plants on the garden website

This guide has one job: to let you add a plant to the website, add a photo to a plant, and change a plant's information, without needing to ask anybody.

Every step is numbered. Do the steps in order. Do not skip a step. After most steps this guide tells you what you will see on the screen. If you do not see it, stop and read the box titled **When something is wrong** on the last page.

The three facts you need

The web address is: **`https://junsgarden.zapto.org/streamlit/`**

Your account email is: **`kopoboi85@gmail.com`**

Your username and password are the ones Jason gave you. They are not written in this guide on purpose.

What this tool is

The tool is called the **Garden Orchestrator**. It is a separate page from the garden website.

The garden website shows the plants to visitors. The Orchestrator is where the plants are added and changed. They both use the same information. This means: when you change a plant in the Orchestrator, the website changes too. You do not have to copy anything across.

What you can and cannot break

You **can** safely: add a plant, add a photo, fix a spelling, change a plant's information.

You **cannot** break the website by typing the wrong thing in a box. A wrong word is just a wrong word, and it can be corrected afterwards.

There is only one action that removes something permanently, and it is covered under **Rules** on the last page.

Part 1 - Opening the Orchestrator

Do this every time, before anything else.

1 Open your web browser.

You will see: The browser window.

2 Click the address bar at the top of the browser. This is the wide box where web addresses are typed.

You will see: The text in the bar becomes highlighted.

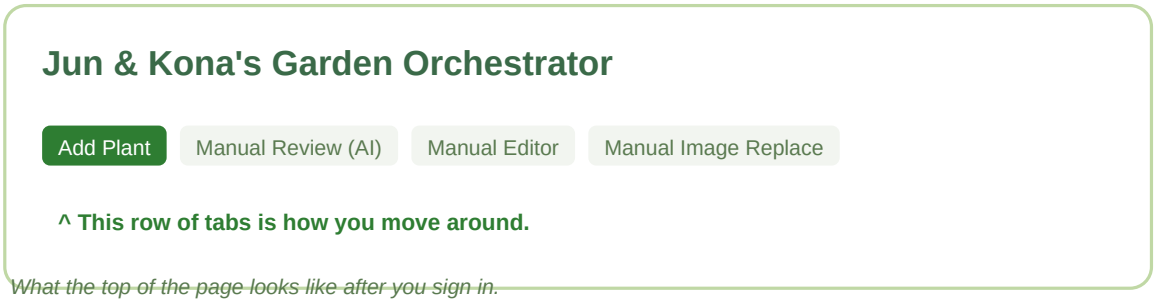
3 Type this address exactly, then press the Enter key:

`https://junsgarden.zapto.org/streamlit/`

You will see: A small box appears asking for a username and a password.

4 Type your username. Then type your password. Then click **Sign in**.

You will see: The box closes. A page opens with the title **Jun & Kona's Garden Orchestrator**.



What the top of the page looks like after you sign in.

If the password box keeps coming back

The username or the password was not correct.

Type them again slowly. Check that Caps Lock is off.

If it is still wrong after three tries, stop and ask Jason. Trying many more times will not help.

Part 2 - Adding a new plant

Use this when you have a plant that is not on the website yet.

1 Click the tab named **Add Plant**. It is the first tab.
You will see: A heading that reads **Add a New Plant**.

2 Find the box labelled **Account email**. Click inside it.
You will see: A cursor blinking inside the box.

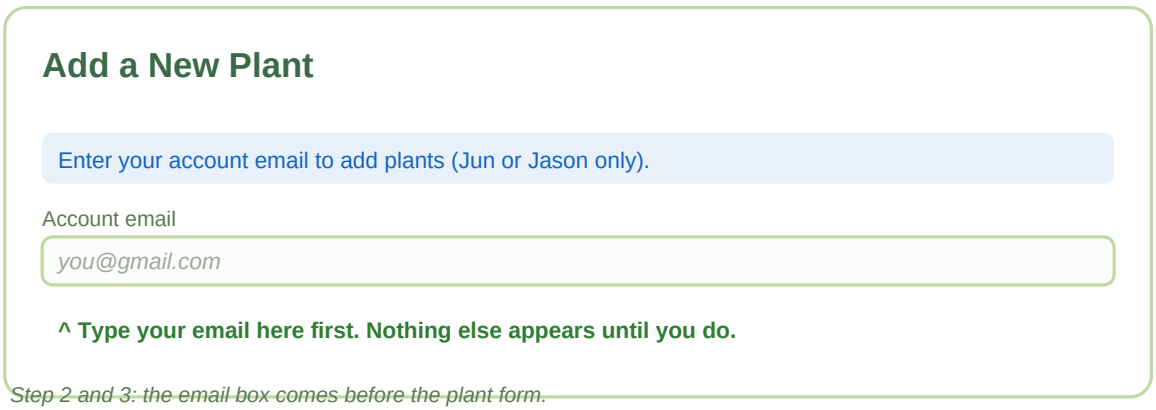
3 Type your email exactly:
`kopoboi85@gmail.com`
Then press the Enter key.
You will see: The email box goes away. A heading appears that reads **Step 1 · Name the Plant**.

4 Find the box labelled **Common / Display Name**. Type the name that is printed largest on the plant tag.
You will see: Your typing inside the box.

5 Find the box labelled **Botanical Name**. Type the name printed in italic letters on the plant tag. Italic letters are slanted.
You will see: Your typing inside the box. More of the form now appears below.

6 Fill in any other boxes you know the answer to. If you do not know an answer, leave that box empty. An empty box is fine.

7 Scroll to the bottom of the page. Click the green **Save** button.
You will see: A green message confirming the plant was added.



Step 2 and 3: the email box comes before the plant form.

Step 1 - Name the Plant

Common / Display Name

e.g. Dwarf Hummingbird Mint

Botanical Name

e.g. Agastache cana 'Sinning'

Save

Steps 4 to 7: the two names are required. Everything else is optional.

Two rules about names

Both name boxes must be filled in. The form will not continue with only one of them. This is normal and it is not an error.

Copy the spelling from the plant tag exactly, including capital letters and any words inside quote marks.

Part 3 - Adding a photo to a plant

Use this when a plant is already on the website and you have taken a photo of it.

1	Take the photo with your phone first. Make sure the plant fills most of the picture.
2	Put the photo onto this computer. If you do not know how, ask Jason to show you once, then write his answer in the blank space at the end of this guide. You will see: The photo file on the computer.
3	In the Orchestrator, click the tab named **Manual Image Replace**. You will see: A page for changing plant photos.
4	Find the plant you want. Use the search box if there is one, and type the plant's name. You will see: The plant's name and its current photo.
5	Click the **Browse files** button. A file window opens. You will see: A window showing the files on the computer.
6	Click your photo once. Then click **Open**. You will see: The file window closes. The photo name appears in the Orchestrator.
7	Click the green **Save** button. You will see: A green message confirming the photo was saved.
8	Open the garden website and look at that plant to check the photo is there. You will see: Your new photo on the website.

Good photos and bad photos

Good: taken outside in daylight, plant fills the picture, camera held still.

Bad: very dark, plant far away and small, blurry.

A bad photo is not a problem. You can add a better one later using these same steps. The new photo replaces the old one.

Part 4 - Changing a plant's information

Use this when a plant is already on the website and something about it is wrong or missing.

1. Click the tab named **Manual Editor**.
   You will see: A page for editing plants.
2. Find the plant you want to change.
   You will see: That plant's information in boxes.
3. Click inside the box you want to change.
   You will see: A cursor blinking inside the box.
4. Delete the wrong text. Type the correct text.
   You will see: Your new text inside the box.
5. Click the green **Save** button.
   You will see: A green message confirming the change was saved.

What the other tabs are for

You do not need these tabs to add plants or photos. This list is only so that the words on screen are not confusing.

Tab name	What it is for
Add Plant	Adding a plant that is not on the website yet.
Manual Editor	Changing information on a plant that already exists.
Manual Image Replace	Adding or changing a plant's photo.
Awaiting Approval	Plants that have been added but not checked yet.
Fully Approved & Verified	Plants that have been checked and are finished.
Flagged for Review	Plants that somebody marked as needing another look.
Manual Review (AI)	Jason's tool. The computer suggests information.
Fill Missing Data (AI)	Jason's tool. The computer fills empty boxes.
JSON Pipeline	Only used when following Part 5 of this guide.
Bed Assignment	Saying which garden bed a plant is planted in.
Barcodes	Looking a plant up by scanning its barcode.

If anything does not match this guide, stop and ask Jason.

Wishlist	Plants you want to buy but do not own yet.

Part 5 - Filling in a plant with Gemini

This part is OPTIONAL. Skip it if you do not want to use it. Adding plants by hand (Part 2) works perfectly well on its own.

Use this when a plant is on the website but most of its boxes are empty, and you want them filled in without looking everything up yourself. Gemini is a free website made by Google that can do this.

The three files this uses

setup.txt - the long instructions for Gemini. You copy this whole file and paste it into Gemini.

Copy_paste_Prompt.txt - a short extra sentence you can add after the long one.

Plant_schema.json - the rules list. You do not need to open this one. It is there for Jason.

All three are in the folder **`prompts`** next to this guide.

1	In the Orchestrator, click the tab named **JSON Pipeline**. **Read this first:** the Rules page says never to use this tab. That rule still applies when you are working on your own. Only use this tab while following Part 5. You will see: A page with export and import sections.
2	Export the plants you want filled in. Choose **5 plants or fewer** at a time. More than 5 does not work reliably. You will see: A block of text that starts with a square bracket [and ends with a square bracket]. This is called JSON.
3	Copy that whole block of text. Do not miss the brackets at either end.
4	Open the file **setup.txt** from the prompts folder. Select everything in it and copy it. You will see: The whole file highlighted.
5	Go to **`gemini.google.com`** and start a **new chat**. A new chat every time. Do not reuse an old one. You will see: An empty chat box.
6	Paste setup.txt into the chat box. Do not press Enter yet. You will see: A very long block of text in the chat box.
7	Find the words **`[PASTE YOUR JSON HERE]`** at the very bottom. Delete those words. Paste your plant JSON in their place. You will see: Your plant text where those words used to be.

8	Press Enter. Wait. This takes a minute. You will see: Gemini replies with a new block of JSON.
9	Copy Gemini's reply. Go back to the Orchestrator, to the import section of the **JSON Pipeline** tab, and paste it in. You will see: A list of what will change.
10	**Read the list before saving.** If anything looks wrong, do not save. Tell Jason instead. You will see: The changes listed, one by one.
11	If it all looks right, click **Save**. You will see: A green message confirming the import.

Why you must check Gemini's answer

Gemini is usually right, but it is **not always right**. It can state a wrong fact in a confident voice.

The instructions in setup.txt tell it to leave a box empty rather than guess. It mostly obeys that. Mostly is not always.

This is why step 10 exists. An empty box is fine. A wrong fact on the website is not.

If you are unsure about even one value, do not save. Ask Jason. Nothing bad happens from waiting.

Rules

These rules have no exceptions. If a rule and your own judgement disagree, follow the rule and tell Jason afterwards.

Never do these

1. Never click a button labelled **Delete** or **Remove**. Deleting cannot be undone. If a plant needs deleting, tell Jason and let him do it.

2. Only use the tab named **JSON Pipeline** while following Part 5 of this guide, with the guide open in front of you. Never on your own.

3. Never give your username or password to anybody, including somebody who says they are helping with the website.

4. Never type real information into a box you are only experimenting with. There is no practice mode. Everything you save goes onto the real website straight away.

When something is wrong

Work down this list in order. Stop as soon as one of them fixes it.

1	Wait ten seconds and look again. The page is sometimes still working.
2	Press the **F5** key to reload the page. Then sign in again if it asks you to.
3	Close the browser completely. Open it again. Go back to Part 1 and start from step 1.
4	If it is still wrong, tell Jason. Tell him these three things: what you were doing, what you expected to see, and what you saw instead. Those three things are what he needs.

Two things that look like errors but are not

The page goes grey and says RUNNING for a few seconds. This is normal. The tool is thinking. Wait for it to finish.

A plant you added is not on the website immediately. Reload the website page with the F5 key. It is usually there.

Notes

Write anything Jason explains to you here, so you do not have to ask twice.
